

# Control inventory costs and manage your entire warehouse

Exact Warehouse Management System (WMS) improves efficiency and productivity

**Exact WMS enables you to control and track the movement and storage of materials through your warehouse. It provides the critical information you need to make daily business decisions that impact your customers, suppliers and profitability.**

#### Modular to fit your needs

**Device Manager** – This provides global functionality for each of the WMS modules. It provides its own security system to ensure that only authorized warehouse personnel can use the software, and supports both attached PCs and a variety of radio frequency data collection devices.

#### Receiving & Inventory Data

**Collection** – Accurate inventory management is essential to customer satisfaction and employee productivity. The first step to having an accurate inventory is processing receipts accurately. The Receiving & Inventory Data Collection Module utilizes radio frequency functionality to scan bar-coded items (or a bar-coded receiving scan sheet) as items are received, enabling you to immediately

verify receipts against the Exact database for proper quantity and status. User-definable put-away tickets can be generated with primary and secondary bin locations, along with additional product information. This simplifies moving items from the dock to the recommended put-away location.

This module supports multi-bin, serialized and lotted items, and reads most vendor-designed bar codes in a single scan. For items without bar codes, you can configure the system to automatically generate labels for individual selling units, inner packs, cartons and pallets. This ensures that all items in the warehouse are labeled for subsequent inventory and shipping transactions - all without user intervention.

- 1** Scan and verify deliveries as they are received—right on the dock
- 2** Automatically print product labels for received items
- 3** Execute real-time inventory transactions, with full bin/serial/lot support
- 4** Manage the picking process from a single screen - without the need to print pick tickets
- 5** Verify products as they are packed and shipped, automatically generating bills of lading

**= exact**

And it all comes together.

Once products are received, you will be able to easily manage and track the movement of material through the warehouse.

**Pick and Ship Verification** – Did you ever wish you could avoid printing paper-based pick tickets? Would you like to combine orders into bulk or wave picks? Now you can! The Pick and Ship Verification Module gives you the tools you need to manage the process from a single screen. The WMS provides full electronic picking, replacing traditional paper pick tickets with an electronic form. Each “Pick” is a uniquely numbered historical document, allowing you to track full picking and shipping history.

If you ship cartons that contain various products, WMS helps to eliminate shipping errors. As products are scanned and packed into cartons, the system automatically notifies you if the incorrect item is being scanned, if you are over or undershipping, or if the item is not on the order. And, as products are packed into cartons, WMS automatically generates customer-specific shipping labels, each with a unique license plate for complete traceability. WMS often pays for itself simply by reducing errors and customer claims!

**Auto Pack Processing** – This module is ideal for companies that ship large quantities of items in standard packages. This function automatically prints carton labels for standard pack shipments based on the quantities printed on the pick ticket and automatically associates the correct item and quantities with each bar-coded label.

You also can track each shipped pallet with a unique license plate. You can determine which pallets are assigned to which shipments as the trucks are being loaded, as well as which cartons were assigned to each pallet. Trading partner required EDI UCC-128 labels can be generated for the pallet and/or the cartons if needed.

### Choose these Add-on Solutions to Further Simplify Warehouse Management

**Best of Pick Management** – Best of Pick Management provides users with access to the Order Shipping Instructions, Order Header Comments, Ship Via and more from within all three EPN modes. It also allows storing a Bin Number on pallets packed, as

well as weight and notes if desired. Users can then be directed to the right pallets when shipping. The Bin Master File solution is included in this module.

**Bin Master File** – As a true bin master file for WMS transactions, all receiving transactions in WMS will validate against this new table. This prevents bins from being accidentally created when an incorrect bar code is scanned.

**Feature Kit Item** – The WMS Feature Kit Item add-on solution provides the ability to scan and record individual components, along with bin, serial or lot information. WMS records which cartons and/or pallets the component items are shipped in and ensures that the proper components are packed. The system is compatible with Macola invoicing. It will fully support the same component on multiple Feature and Kit Items, as well as loose additional quantities within an order.

**Quarantine Processing Module** – The Quarantine Processing add-on module provides an alternative to the Macola Receiving Inspection process for customers that are required to maintain lot information immediately upon receipt.

**SFC Material Transfer** – The SFC Material Transfer provides a simple way to move product that has been issued to a Shop Order to another Shop Order or to a different bin than from where it was originally pulled from. This is especially useful for lotted product, as it does not require the user to know the original bin. It simply asks for the lot number and performs a Material Return to the original bin. It then either issues it to a new Shop Order or transfers it to the desired bin automatically.

**Starship Interface** – The Starship Interface provides the ability to seamlessly connect to Starship from within the WMS Pack Cartons functions from the Desktop Shipping application. In addition, it automatically provides a link between the UCC-128 number created by WMS and the Tracking Number created in Starship.

**AutoShip** – AutoShip makes quick work of managing the creation of thousands of shipments needed for direct to store shipping, or combining thousands of orders into a small number of shipments based on distribution centers.
